

**PRELIMINARY ANALYSIS OF TRENDS IN NEAR-SURFACE TEMPERATURE,  
ATMOSPHERIC PRESSURE AND WIND SPEED DURING THE LAST 20 YEARS AT  
SOME AUTOMATIC WEATHER STATIONS IN ANTARCTICA.**

The Italian National Antarctic Research Programme operates a network of Automatic Weather Stations in Antarctica. Some of those Stations have almost 20 years of continuous recording. Trends in the near-surface temperature, atmospheric pressure and wind speed have been investigated for stations with longer records. Although the length of the records is shorter, results seem to agree with similar analyses published in some recent studies.
